b-baryon ADMIXTURE (Λ_b, Ξ_b, Σ_b, Ω_b)

b-baryon ADMIXTURE MEAN LIFE

Each measurement of the *b*-baryon mean life is an average over an admixture of various *b* baryons which decay weakly. Different techniques emphasize different admixtures of produced particles, which could result in a different *b*-baryon mean life.

"OUR EVALUATION" is an average of the data listed below performed by the LEP *B* Lifetimes Working Group as described in our review "Production and Decay of *b*-flavored Hadrons" in the $B^{\pm}$ Section of these Listings. The averaging procedure takes into account correlations between the measurements and asymmetric lifetime errors.

b-baryon ADMIXTURE (Λ_b,Ξ_b,Σ_b,Ω_b)

These branching fractions are actually an average over weakly decaying b-baryons weighted by their production rates in Z decay (or high-energy $p\overline{p}$), branching ratios, and detection efficiencies. They scale with the LEP b-baryon production fraction B($b \rightarrow$ b-baryon) and are evaluated for our value B($b \rightarrow$ b-baryon) = $(10.1^{+3.9}_{-3.1})$%.

The branching fractions B(b-baryon $\rightarrow$ $\Lambda\ell^-\overline{\nu}_\ell$anything) and B($\Lambda_b^0 \rightarrow$ $\Lambda_c^+\ell^-\overline{\nu}_\ell$anything) are not pure measurements because the underlying measured products of these with B($b \rightarrow$ b-baryon) were used to determine B($b \rightarrow$ b-baryon), as described in the note "Production and Decay of b-Flavored Hadrons."

The values and averages in this section serve only to show what values result if one assumes our B($b \to$ b-baryon). They cannot be thought of as measurements since the underlying product branching fractions were also used to determinine B($b \to$ b-baryon) as described in the note on "Production and Decay of b-Flavored Hadrons."
