## ANOMALOUS W/Z QUARTIC COUPLINGS

Revised November 2003 by C. Caso (University of Genova) and A. Gurtu (Tata Institute).

The Standard Model predictions for WWWW, WWZZ,  $WWZ\gamma$ ,  $WW\gamma\gamma$ , and  $ZZ\gamma\gamma$  couplings are small at LEP, but expected to become important at a TeV Linear Collider. Outside the Standard Model framework such possible couplings,  $a_0, a_c, a_n$ , are expressed in terms of the following dimension-6 operators [1,2];

$$\begin{split} L_{6}^{0} &= -\frac{e^{2}}{16\Lambda^{2}} \; a_{0} \; F^{\mu\nu} \; F_{\mu\nu} \vec{W}^{\alpha} \cdot \vec{W}_{\alpha} \\ L_{6}^{c} &= -\frac{e^{2}}{16\Lambda^{2}} \; a_{c} \; F^{\mu\alpha} \; F_{\mu\beta} \vec{W}^{\beta} \cdot \vec{W}_{\alpha} \\ L_{6}^{n} &= -i \frac{e^{2}}{16\Lambda^{2}} \; a_{n} \epsilon_{ijk} \; W_{\mu\alpha}^{(i)} \; W_{\nu}^{(j)} \; W^{(k)\alpha} F^{\mu\nu} \\ \widetilde{L}_{6}^{0} &= -\frac{e^{2}}{16\Lambda^{2}} \; \widetilde{a}_{0} \; F^{\mu\nu} \; \widetilde{F}_{\mu\nu} \vec{W}^{\alpha} \cdot \vec{W}_{\alpha} \\ \widetilde{L}_{6}^{n} &= -i \frac{e^{2}}{16\Lambda^{2}} \; \widetilde{a}_{n} \epsilon_{ijk} \; W_{\mu\alpha}^{(i)} \; W_{\nu}^{(j)} \; W^{(k)\alpha} \widetilde{F}^{\mu\nu} \end{split}$$

where F,W are photon and W fields,  $L_6^0$  and  $L_6^c$  conserve C, P separately ( $\widetilde{L}_6^0$  conserves only C) and generate anomalous  $W^+W^-\gamma\gamma$  and  $ZZ\gamma\gamma$  couplings,  $L_6^n$  violates CP ( $\widetilde{L}_6^n$  violates both C and P) and generates an anomalous  $W^+W^-Z\gamma$  coupling, and  $\Lambda$  is a scale for new physics. For the  $ZZ\gamma\gamma$  coupling the CP-violating term represented by  $L_6^n$  does not contribute. These couplings are assumed to be real and to vanish at tree level in the Standard Model.

Within the same framework as above, a more recent description of the quartic couplings [3] treats the anomalous parts of the  $WW\gamma\gamma$  and  $ZZ\gamma\gamma$  couplings separately leading to two sets parameterized as  $a_0^V/\Lambda^2$  and  $a_c^V/\Lambda^2$ , where V=W or Z.

At LEP the processes studied in search of these quartic couplings are  $e^+e^- \to WW\gamma$ ,  $e^+e^- \to \gamma\gamma\nu\overline{\nu}$ , and  $e^+e^- \to Z\gamma\gamma$  and limits are set on the quantities  $a_0^W/\Lambda^2$ ,  $a_c^W/\Lambda^2$ ,  $a_n/\Lambda^2$ . The characteristics of the first process depend on all the three couplings whereas those of the latter two depend only on the two CP-conserving couplings. The sensitive measured variables are the cross sections for these processes as well as the energy and angular distributions of the photon and recoil mass to the photon pair.
