μ MASS (atomic mass units u)

The muon's mass is obtained from the muon-electron mass ratio as determined from the measurement of Zeeman transition frequencies in muonium ($\mu^+ e^-$ atom). Since the electron's mass is most accurately known in u, the muon's mass is also most accurately known in u. The conversion factor to MeV has approximately the same relative uncertainty as the mass of the muon in u. In this datablock we give the result in u, and in the following datablock in MeV.

μ MASS

2010 CODATA (MOHR 12) gives the conversion factor from u (atomic mass units, see the above datablock) to MeV as 931.494 061 (21). Earlier values use the then-current conversion factor. The conversion error contributes significantly to the uncertainty of the masses given below.

μ/p MAGNETIC MOMENT RATIO

This ratio is used to obtain a precise value of the muon mass and to reduce experimental muon Larmor frequency measurements to the muon magnetic moment anomaly. Measurements with an error > 0.00001 have been omitted. By convention, the minus sign on this ratio is omitted. CODATA values were fitted using their selection of data, plus other data from multiparameter fits.

μ MAGNETIC MOMENT ANOMALY

The parity-violating decay of muons in a storage ring is observed. The difference frequency ω_a between the muon spin precession and the orbital angular frequency $(e/m_\mu c)\langle B \rangle$ is measured, as is the free proton NMR frequency ω_p , thus determining the ratio $R = \omega_a/\omega_p$. Given the magnetic moment ratio $\lambda = \mu_\mu/\mu_p$ (from hyperfine structure in muonium), $(g-2)/2 = R/(\lambda - R)$.

$$\mu_\mu/(e\hbar/2m_\mu)-1 = (g_\mu-2)/2$$

0.97 ± 0.05	BARDON	59	CNTR	Bromoform target

⁴³ The corresponding 90% confidence limit from IMAZATO 92 is $|\xi P_\mu| > 0.990$. This measurement is of K^+ decay, not π^+ decay, so we do not include it in an average, nor do we yet set up a separate data block for K results.

⁴⁴ Depolarization by medium not known sufficiently well.

$\xi \times (\mu \text{ LONGITUDINAL POLARIZATION}) \times \delta / \rho$

VALUE	CL%	DOCUMENT ID	TECN	CHG	COMMENT
1.00179 ± 0.00156	45	BAYES	11	TWST	+ Surface μ^+ beam
• • • We do not use the following data for averages, fits, limits, etc. • • •					
>0.99682	90	⁴⁶ JODIDIO	86	SPEC	+ TRIUMF
>0.9966	90	⁴⁷ STOKER	85	SPEC	+ μ -spin rotation
>0.9959	90	CARR	83	SPEC	+ 11 kG

- ⁴⁵ BAYES 11 obtains the limit > 0.99909 (90% CL) with the constraint that $\xi \times (\mu \text{ LON-GITUDINAL POLARIZATION}) \times \delta/\rho \leq 1.0$.
- ⁴⁶ JODIDIO 86 includes data from CARR 83 and STOKER 85. The value here is from the erratum.
- ⁴⁷ STOKER 85 find $(\xi P_\mu \delta/\rho) > 0.9955$ and > 0.9966 , where the first limit is from new μ spin-rotation data and the second is from combination with CARR 83 data. In $V-A$ theory, $(\delta/\rho) = 1.0$.

ξ' = LONGITUDINAL POLARIZATION OF e^+

$(V-A)$ theory predicts the longitudinal polarization = ± 1 for e^\pm , respectively. We have flipped the sign for e^- so our programs can average.
