$I^G(J^{PC}) = 0^-(1^{--})$

Mass  $m = 4415 \pm 5$  MeVFull width  $\Gamma = 110 \pm 22$  MeV (S = 2.3)

Due to the complexity of the  $c\bar{c}$  threshold region, in this listing, “seen” (“not seen”) means that a cross section for the mode in question has been measured at effective  $\sqrt{s}$  near this particle’s central mass value, more (less) than  $2\sigma$  above zero, without regard to any peaking behavior in  $\sqrt{s}$  or absence thereof. See mode listing(s) for details and references.

## NOTES

[a] For  $E_\gamma > 100$  MeV.

[b] The value is for the sum of the charge states or particle/antiparticle states indicated.

[c]  $\Theta(1540)$  is a hypothetical pentaquark state of 1.54 GeV/c<sup>2</sup> mass and a width of less than 25 MeV/c<sup>2</sup>.

[d] Includes  $p\bar{p}\pi^+\pi^-\gamma$  and excludes  $p\bar{p}\eta$ ,  $p\bar{p}\omega$ ,  $p\bar{p}\eta'$ .

[e] For a narrow state  $A$  with mass less than 960 MeV.

[f] For a narrow scalar or pseudoscalar  $A^0$  with mass 0.21–3.0 GeV.

[g] For a dark photon  $U$  with mass between 100 and 2100 MeV.

[h] For a narrow resonance in the range  $2.2 < M(X) < 2.8$  GeV.

[i]  $J^{PC}$  known by production in  $e^+e^-$  via single photon annihilation.  $J^G$  is not known; interpretation of this state as a single resonance is unclear because of the expectation of substantial threshold effects in this energy region.
