

$$I(J^P) = \frac{1}{2}(0^-)$$

## D<sup>0</sup> MASS

The fit includes  $D^\pm$ ,  $D^0$ ,  $D_s^\pm$ ,  $D^{*\pm}$ ,  $D^{*0}$ ,  $D_s^{*\pm}$ ,  $D_1(2420)^0$ ,  $D_2^*(2460)^0$ , and  $D_{s1}(2536)^\pm$  mass and mass difference measurements.

Given the recent addition of much more precise measurements, we have omitted all those masses published up through 1990. See any Review before 2015 for those earlier results.

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT
<b>1864.84 ± 0.05 OUR FIT</b>				
<b>1864.84 ± 0.05 OUR AVERAGE</b>				
1864.845 ± 0.025 ± 0.057	63k	<sup>1</sup> TOMARADZE 14		$D^0 \rightarrow K^- 2\pi^+ \pi^-$
1864.75 ± 0.15 ± 0.11		AAIJ	13V LHCb	$D^0 \rightarrow K^+ 2K^- \pi^+$

1864.847 ± 0.150 ± 0.095	0.3k	CAWLFIELD	07 CLEO	$D^0 \rightarrow K_S^0 \phi$

<sup>1</sup> Obtained by analyzing CLEO-c data but not authored by the CLEO Collaboration. The largest source of error in the TOMARADZE 14 value is from the uncertainties in the  $K^-$  and  $K_S^0$  masses. The systematic error given above is the addition in quadrature of  $\pm 0.022 \pm 0.053$  MeV, where the second error is from those mass uncertainties.

<sup>2</sup> The largest source of error in the LEES 13S value is from the uncertainty of the  $K^+$  mass. The quoted systematic error is in fact  $\pm 0.043 + 3 (m_{K^+} - 493.677)$ , in MeV.

## $m_{D^\pm} - m_{D^0}$

The fit includes  $D^\pm$ ,  $D^0$ ,  $D_s^\pm$ ,  $D^{*\pm}$ ,  $D^{*0}$ ,  $D_s^{*\pm}$ ,  $D_1(2420)^0$ ,  $D_2^*(2460)^0$ , and  $D_{s1}(2536)^\pm$  mass and mass difference measurements.

<sup>1</sup> ABUDINEN 21A determines the lifetime ratio  $\tau(D^+)/\tau(D^0) = 2.510 \pm 0.013 \pm 0.007$ .

<sup>2</sup> BARLAG 90C estimate systematic error to be negligible.

See the related review(s):

## $D^0 - \bar{D}^0$ Mixing

$$|m_{D_1^0} - m_{D_2^0}| = x \Gamma$$

The  $D_1^0$  and  $D_2^0$  are the mass eigenstates of the  $D^0$  meson, as described in the note on “ $D^0$ - $\bar{D}^0$  Mixing,” above. The experiments usually present  $x \equiv \Delta m/\Gamma$ . Then  $\Delta m = x \Gamma = x \hbar/\tau$ .

<sup>1</sup> AAIJ 23BC analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  from  $B \rightarrow D^0 \mu\nu X$  events allows for  $CP$  violation (none seen). |

<sup>2</sup> AAIJ 21AB measurement allows for  $CP$  violation (none seen).

<sup>3</sup> AAIJ 19X  $D^0$  come from  $D^{*+}$  and  $\bar{B} \rightarrow D^0 \mu^- X$  decays (and c.c.). Measurement allows for  $CP$  violation (none seen).

<sup>4</sup> The result was established with  $D^0$  from prompt and secondary  $D^*$ . Based on  $5 \text{ fb}^{-1}$  of data collected at  $\sqrt{s} = 7, 8, 13 \text{ TeV}$ . Assumes no  $CP$  violation. Reported  $x'^2 = (3.9 \pm 2.7) \times 10^{-5}$  and  $y' = (5.28 \pm 0.52) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y$

<sup>5</sup> Model-independent measurement of the charm mixing parameters in the decay  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  using  $1.0 \text{ fb}^{-1}$  of LHCb data at  $\sqrt{s} = 7 \text{ TeV}$ .

<sup>6</sup> Time-dependent amplitude analysis of  $D^0 \rightarrow \pi^+ \pi^- \pi^0$ .

<sup>7</sup> Based on  $976 \text{ fb}^{-1}$  of data collected at  $Y(nS)$  resonances. Assumes no  $CP$  violation. Reported  $x'^2 = (0.09 \pm 0.22) \times 10^{-3}$  and  $y' = (4.6 \pm 3.4) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .

<sup>8</sup> The time-dependent Dalitz-plot analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  is employed. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between  $D^0 \rightarrow K^{*+} \pi^-$  and  $\bar{D}^0 \rightarrow K^{*+} \pi^-$ . This value allows  $CP$  violation and is sensitive to the sign of  $\Delta m$ .

<sup>9</sup> Based on  $9.6 \text{ fb}^{-1}$  of data collected at the Tevatron. Assumes no  $CP$  violation. Reported  $x'^2 = (0.08 \pm 0.18) \times 10^{-3}$  and  $y' = (4.3 \pm 4.3) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .

<sup>10</sup> DEL-AMO-SANCHEZ 10D uses  $540,800 \pm 800 K_S^0 \pi^+ \pi^-$  and  $79,900 \pm 300 K_S^0 K^+ K^-$  events in a time-dependent amplitude analysis of the  $D^0$  and  $\bar{D}^0$  Dalitz plots. No evidence was found for  $CP$  violation, and the values here assume no such violation.

<sup>11</sup> The result was established with  $D^0$  from prompt and secondary  $D^*$ . Based on  $3 \text{ fb}^{-1}$  of data collected at  $\sqrt{s} = 7, 8 \text{ TeV}$ . Assumes no  $CP$  violation. Reported  $x'^2 = (3.6 \pm 4.3) \times 10^{-5}$  and  $y' = (5.23 \pm 0.84) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .

<sup>12</sup> Based on  $3 \text{ fb}^{-1}$  of data collected at  $\sqrt{s} = 7, 8 \text{ TeV}$ . Assumes no  $CP$  violation. Reported  $x'^2 = (5.5 \pm 4.9) \times 10^{-4}$  and  $y' = (4.8 \pm 1.0) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .

<sup>13</sup> Based on  $1 \text{ fb}^{-1}$  of data collected at  $\sqrt{s} = 7 \text{ TeV}$  in 2011. Assumes no  $CP$  violation. Reported  $x'^2 = (-0.9 \pm 1.3) \times 10^{-4}$  and  $y' = (7.2 \pm 2.4) \times 10^{-3}$ , where  $x' = x \cos(\delta)$

- +  $y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- <sup>14</sup>The AUBERT 09AN values are inferred from the branching ratio  $\Gamma(D^0 \rightarrow K^+ \pi^- \pi^0)$  via  $\bar{D}^0)/\Gamma(D^0 \rightarrow K^- \pi^+ \pi^0)$  given near the end of this Listings. Mixing is distinguished from DCS decays using decay-time information. Interference between mixing and DCS is allowed. The phase between  $D^0 \rightarrow K^+ \pi^- \pi^0$  and  $\bar{D}^0 \rightarrow K^+ \pi^- \pi^0$  is assumed to be small. The width difference here is  $y''$ , which is not the same as  $y_{CP}$  in the note on  $D^0$ - $\bar{D}^0$  mixing.
- <sup>15</sup>LOWREY 09 uses quantum correlations in  $e^+ e^- \rightarrow D^0 \bar{D}^0$  at the  $\psi(3770)$ . See below for coherence factors and average relative strong phases for both  $D^0 \rightarrow K^- \pi^+ \pi^0$  and  $D^0 \rightarrow K^- \pi^- 2\pi^+$ . A fit that includes external measurements of charm mixing parameters gets  $\Delta m = (2.34 \pm 0.61) \times 10^{10} \text{ } \hbar \text{ s}^{-1}$ .
- <sup>16</sup>The ASNER 05 and ZHANG 07B values are from the time-dependent Dalitz-plot analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ . Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between  $D^0 \rightarrow K^{*+} \pi^-$  and  $\bar{D}^0 \rightarrow K^{*+} \pi^-$ . This value allows  $CP$  violation and is sensitive to the sign of  $\Delta m$ .
- <sup>17</sup>The AUBERT 03Z, LI 05A, and ZHANG 06 limits are inferred from the  $D^0$ - $\bar{D}^0$  mixing ratio  $\Gamma(K^+ \pi^-)$  (via  $\bar{D}^0))/\Gamma(K^- \pi^+)$  given near the end of this  $D^0$  Listings. Decay-time information is used to distinguish DCS decays from  $D^0$ - $\bar{D}^0$  mixing. The limit allows interference between the DCS and mixing ratios, and also allows  $CP$  violation. AUBERT 03Z assumes the strong phase between  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$  amplitudes is small; if an arbitrary phase is allowed, the limit degrades by 20%. The LI 05A and ZHANG 06 limits are valid for an arbitrary strong phase.
- <sup>18</sup>This LINK 05H limit is inferred from the  $D^0$ - $\bar{D}^0$  mixing ratio  $\Gamma(K^+ \pi^-)$  (via  $\bar{D}^0))/\Gamma(K^- \pi^+)$  given near the end of this  $D^0$  Listings. Decay-time information is used to distinguish DCS decays from  $D^0$ - $\bar{D}^0$  mixing. The limit allows interference between the DCS and mixing ratios, and also allows  $CP$  violation. The strong phase between  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$  is assumed to be small. If an arbitrary relative strong phase is allowed, the limit degrades by 25%.
- <sup>19</sup>This GODANG 00 limit is inferred from the  $D^0$ - $\bar{D}^0$  mixing ratio  $\Gamma(K^+ \pi^-)$  (via  $\bar{D}^0))/\Gamma(K^- \pi^+)$  given near the end of this  $D^0$  Listings. Decay-time information is used to distinguish DCS decays from  $D^0$ - $\bar{D}^0$  mixing. The limit allows interference between the DCS and mixing ratios, and also allows  $CP$  violation. The strong phase between  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$  is assumed to be small. If an arbitrary relative strong phase is allowed, the limit degrades by a factor of two.
- <sup>20</sup>AITALA 98 allows interference between the doubly Cabibbo-suppressed and mixing amplitudes, and also allows  $CP$  violation in this term, but assumes that  $A_D = A_R = 0$ . See the note on “ $D^0$ - $\bar{D}^0$  Mixing,” above.
- <sup>21</sup>This limit is inferred from  $R_M$  for  $f = K^+ \pi^-$  and  $f = K^+ \pi^- \pi^+ \pi^-$ . See the note on “ $D^0$ - $\bar{D}^0$  Mixing,” above. Decay-time information is used to distinguish doubly Cabibbo-suppressed decays from  $D^0$ - $\bar{D}^0$  mixing.
- <sup>22</sup>This limit is inferred from  $R_M$  for  $f = K^+ \ell^- \bar{\nu}_\ell$ . See the note on “ $D^0$ - $\bar{D}^0$  Mixing,” above.
- <sup>23</sup>ANJOS 88C assumes that  $y = 0$ . See the note on “ $D^0$ - $\bar{D}^0$  Mixing,” above. Without this assumption, the limit degrades by about a factor of two.

---

$$(\Gamma_{D_1^0} - \Gamma_{D_2^0})/\Gamma = 2y$$

The  $D_1^0$  and  $D_2^0$  are the mass eigenstates of the  $D^0$  meson, as described in the note on “ $D^0$ - $\bar{D}^0$  Mixing,” above.

Due to the strong phase difference between  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ , we exclude from the average those measurements of  $y'$  that are inferred from the  $D^0$ - $\bar{D}^0$  mixing ratio  $\Gamma(K^+ \pi^- \text{ via } \bar{D}^0) / \Gamma(K^+ \pi^-)$  given near the end of this  $D^0$  Listings. OUR AVERAGE assumes  $CP$  conservation, though this is disfavored by data.

In the absence of  $CP$  violation, the experimental measurement of the observable  $y_{CP}$  corresponds to  $y$ . In the presence of  $CP$  violation,  $y_{CP}$  is approximately equal to  $y$  up to a  $CP$ -violating weak phase cosine, that is very close to unity, and higher order  $CP$ -violating effects. Many experiments measure  $y_{CP}$  with respect to a reference channel, such that the quoted results below are often  $y_{CP} \pm y_{CP}(\text{reference})$ . We denote the actual observable and the reference channel below for those experiments with sufficient sensitivity such that  $y_{CP}(\text{reference})$  cannot be neglected.

Some early results have been omitted. See our 2006 Review (Journal of Physics **G33** 1 (2006)).

$$(\Gamma_1 - \Gamma_2)/\Gamma = 2y$$

<sup>1</sup> AAIJ 23BC analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  from  $B \rightarrow D^0 \mu\nu X$  events allows for  $CP$  violation (none seen). █

- <sup>2</sup> AAIJ 22O is the combination of the measurement in the  $D^0 \rightarrow \pi^- \pi^+$  channel and the one in the  $D^0 \rightarrow K^- K^+$  channel, that are  $(1.314 \pm 0.106 \pm 0.032)\%$  and  $(1.416 \pm 0.060 \pm 0.028)\%$  respectively, assuming fully correlated systematics except those related to peaking backgrounds.
- <sup>3</sup> AAIJ 21AB analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  events allows for  $CP$  violation (none seen).
- <sup>4</sup> NAYAK 20 reports  $(1.92 \pm 1.82 \pm 1.24^{+0.34}_{-0.00}) \times 10^{-2}$  where the last uncertainty is due to possible presence of  $CP$ -even decays in the data sample. Extracts  $y_{CP} = (\Gamma_{CP+} - \Gamma_{CP-}) / (\Gamma_{CP+} + \Gamma_{CP-})$  in  $D^0 \rightarrow K_S^0 \omega$  versus  $\bar{D}^0 \rightarrow K_S^0 \omega$ , by measuring the decay lifetime of  $D^0 \rightarrow K_S^0 \omega$  with  $\omega \rightarrow \pi^+ \pi^- \pi^0$  versus  $D^0 \rightarrow K^- \pi^+$ . We list  $2y_{CP} = 2y (= \Delta\Gamma/\Gamma)$  in the absence of  $CP$  violation.
- <sup>5</sup> Based on  $3 \text{ fb}^{-1}$  of data collected at  $\sqrt{s} = 7, 8 \text{ TeV}$ . Measures the lifetime difference between  $D^0 \rightarrow K^- K^+$  and  $D^0 \rightarrow \pi^- \pi^+$  ( $CP$  even) decays and  $D^0 \rightarrow K^- \pi^+$  ( $CP$  mixed) decays, or  $y_{CP} = (\Gamma_{CP+} - \Gamma_{CP-}) / (\Gamma_{CP+} + \Gamma_{CP-})$ . The  $D^0$  mesons are required to originate from semimuonic decays of  $B$  mesons. We list  $2y_{CP} = \Delta\Gamma/\Gamma$ .
- <sup>6</sup> AAIJ 19X  $D^0$  come from  $D^{*+}$  and  $\bar{B} \rightarrow D^0 \mu^- X$  decays (and c.c.) in  $p p$  collisions at 7 and 8 TeV. Measurement allows for  $CP$  violation (none seen).
- <sup>7</sup> The result was established with  $D^0$  from prompt and secondary  $D^*$ . Based on  $5 \text{ fb}^{-1}$  of data collected at  $\sqrt{s} = 7, 8, 13 \text{ TeV}$ . Assumes no  $CP$  violation. Reported  $x'^2 = (3.9 \pm 2.7) \times 10^{-5}$  and  $y' = (5.28 \pm 0.52) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- <sup>8</sup> Model-independent measurement of the charm mixing parameters in the decay  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  using  $1.0 \text{ fb}^{-1}$  of LHCb data at  $\sqrt{s} = 7 \text{ TeV}$ .
- <sup>9</sup> Time-dependent amplitude analysis of  $D^0 \rightarrow \pi^+ \pi^- \pi^0$ .
- <sup>10</sup> An improved measurement of  $\bar{D}^0 - D^0$  mixing and a search for  $CP$  violation in  $D^0$  decays to  $CP$ -even final states  $K^+ K^-$  and  $\pi^+ \pi^-$  using the final Belle data sample of  $976 \text{ fb}^{-1}$ .
- <sup>11</sup> ABLIKIM 15D uses quantum correlations in  $e^+ e^- \rightarrow D^0 \bar{D}^0$  at the  $\psi(3770)$ .
- <sup>12</sup> Based on  $976 \text{ fb}^{-1}$  of data collected at  $Y(nS)$  resonances. Assumes no  $CP$  violation. Reported  $x'^2 = (0.09 \pm 0.22) \times 10^{-3}$  and  $y' = (4.6 \pm 3.4) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- <sup>13</sup> The time-dependent Dalitz-plot analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  is employed. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between  $D^0 \rightarrow K^{*+} \pi^-$  and  $\bar{D}^0 \rightarrow K^{*+} \pi^-$ . This value allows  $CP$  violation and is sensitive to the sign of  $\Delta m$ .
- <sup>14</sup> Based on  $9.6 \text{ fb}^{-1}$  of data collected at the Tevatron. Assumes no  $CP$  violation. Reported  $x'^2 = (0.08 \pm 0.18) \times 10^{-3}$  and  $y' = (4.3 \pm 4.3) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- <sup>15</sup> Obtained  $y_{CP} = (0.72 \pm 0.18 \pm 0.12)\%$  based on three effective  $D^0$  lifetimes measured in  $K^\mp \pi^\pm$ ,  $K^- K^+$ , and  $\pi^- \pi^+$ . We list  $2y_{CP} = \Delta\Gamma/\Gamma$ .
- <sup>16</sup> Compared the lifetimes of  $D^0$  decay to the  $CP$  eigenstate  $K^+ K^-$  with  $D^0$  decay to  $\pi^+ K^-$ . The values here assume no  $CP$  violation.
- <sup>17</sup> DEL-AMO-SANCHEZ 10D uses  $540,800 \pm 800$   $K_S^0 \pi^+ \pi^-$  and  $79,900 \pm 300$   $K_S^0 K^+ K^-$  events in a time-dependent amplitude analyses of the  $D^0$  and  $\bar{D}^0$  Dalitz plots. No evidence was found for  $CP$  violation, and the values here assume no such violation.
- <sup>18</sup> ZUPANC 09 uses a method based on measuring the mean decay time of  $D^0 \rightarrow K_S^0 K^+ K^-$  events for different  $K^+ K^-$  mass intervals.

- 19 LINK 00, AITALA 99E, and ABE 02I measure the lifetime difference between  $D^0 \rightarrow K^- K^+$  ( $CP$  even) decays and  $D^0 \rightarrow K^- \pi^+$  ( $CP$  mixed) decays, or  $y_{CP} = [\Gamma(CP+) - \Gamma(CP-)] / [\Gamma(CP+) + \Gamma(CP-)]$ . We list  $2y_{CP} = \Delta\Gamma/\Gamma$ .
- 20 CSORNA 02 measures the lifetime difference between  $D^0 \rightarrow K^- K^+$  and  $\pi^- \pi^+$  ( $CP$  even) decays and  $D^0 \rightarrow K^- \pi^+$  ( $CP$  mixed) decays, or  $y_{CP} = [\Gamma(CP+) - \Gamma(CP-)] / [\Gamma(CP+) + \Gamma(CP-)]$ . We list  $2y_{CP} = \Delta\Gamma/\Gamma$ .
- 21 The result was established with  $D^0$  from prompt and secondary  $D^*$ . Based on  $3 \text{ fb}^{-1}$  of data collected at  $\sqrt{s} = 7, 8 \text{ TeV}$ . Assumes no  $CP$  violation. Reported  $x'^2 = (3.6 \pm 4.3) \times 10^{-5}$  and  $y' = (5.23 \pm 0.84) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- 22 Based on  $3 \text{ fb}^{-1}$  of data collected at  $\sqrt{s} = 7, 8 \text{ TeV}$ . Assumes no  $CP$  violation. Reported  $x'^2 = (5.5 \pm 4.9) \times 10^{-4}$  and  $y' = (4.8 \pm 1.0) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- 23 Based on  $1 \text{ fb}^{-1}$  of data collected at  $\sqrt{s} = 7 \text{ TeV}$  in 2011. Assumes no  $CP$  violation. Reported  $x'^2 = (-0.9 \pm 1.3) \times 10^{-4}$  and  $y' = (7.2 \pm 2.4) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- 24 This combines the  $y_{CP} = (\tau_{K\pi}/\tau_{KK}) - 1$  using untagged  $K^- \pi^+$  and  $K^- K^+$  events of AUBERT 09AI with the disjoint  $y_{CP}$  using tagged  $K^- \pi^+$ ,  $K^- K^+$ , and  $\pi^- \pi^+$  events of AUBERT 08U.
- 25 The AUBERT 09AN values are inferred from the branching ratio  $\Gamma(D^0 \rightarrow K^+ \pi^- \pi^0$  via  $\bar{D}^0) / \Gamma(D^0 \rightarrow K^- \pi^+ \pi^0)$  given near the end of this Listings. Mixing is distinguished from DCS decays using decay-time information. Interference between mixing and DCS is allowed. The phase between  $D^0 \rightarrow K^+ \pi^- \pi^0$  and  $\bar{D}^0 \rightarrow K^+ \pi^- \pi^0$  is assumed to be small. The width difference here is  $y''$ , which is not the same as  $y_{CP}$  in the note on  $D^0$ - $\bar{D}^0$  mixing.
- 26 LOWREY 09 uses quantum correlations in  $e^+ e^- \rightarrow D^0 \bar{D}^0$  at the  $\psi(3770)$ . See below for coherence factors and average relative strong phases for both  $D^0 \rightarrow K^- \pi^+ \pi^0$  and  $D^0 \rightarrow K^- \pi^- 2\pi^+$ . A fit that includes external measurements of charm mixing parameters gets  $2y = (1.62 \pm 0.32) \times 10^{-2}$ .
- 27 The GODANG 00, AUBERT 03Z, LINK 05H, LI 05A, ZHANG 06, AUBERT 07W, and AALTONEN 08E limits are inferred from the  $D^0$ - $\bar{D}^0$  mixing ratio  $\Gamma(K^+ \pi^-$  (via  $\bar{D}^0)) / \Gamma(K^- \pi^+)$  given near the end of this  $D^0$  Listings. Decay-time information is used to distinguish DCS decays from  $D^0$ - $\bar{D}^0$  mixing. The limits allow interference between the DCS and mixing ratios, and all except AUBERT 07W and AALTONEN 08E also allow  $CP$  violation. The phase between  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$  is assumed to be small. This is a measurement of  $y'$  and is not the same as the  $y_{CP}$  of our note above on “ $D^0$ - $\bar{D}^0$  Mixing.”
- 28 This value combines the results of AUBERT 08U and AUBERT 03P.
- 29 STARIC 07 compares the lifetimes of  $D^0$  decay to the  $CP$  eigenstates  $K^+ K^-$  and  $\pi^+ \pi^-$  with  $D^0$  decay to  $K^- \pi^+$ .
- 30 The ASNER 05 and ZHANG 07B values are from the time-dependent Dalitz-plot analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ . Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between  $D^0 \rightarrow K^{*+} \pi^-$  and  $\bar{D}^0 \rightarrow K^{*+} \pi^-$ . This limit allows  $CP$  violation.
- 31 The ranges of AUBERT 03Z, LINK 05H, LI 05A, and ZHANG 06 measurements are for 95% confidence level.

<sup>32</sup>AUBERT 03P measures  $Y \equiv 2\tau^0 / (\tau^+ + \tau^-) - 1$ , where  $\tau^0$  is the  $D^0 \rightarrow K^-\pi^+$  (and  $\bar{D}^0 \rightarrow K^+\pi^-$ ) lifetime, and  $\tau^+$  and  $\tau^-$  are the  $D^0$  and  $\bar{D}^0$  lifetimes to  $CP$ -even states (here  $K^-K^+$  and  $\pi^-\pi^+$ ). In the limit of  $CP$  conservation,  $Y = y \equiv \Delta\Gamma / 2\Gamma$  (we list  $2y = \Delta\Gamma/\Gamma$ ). AUBERT 03P also uses  $\tau^+ - \tau^-$  to get  $\Delta Y = -0.008 \pm 0.006 \pm 0.002$ .

## |q/p|

The mass eigenstates  $D_1^0$  and  $D_2^0$  are related to the  $C = \pm 1$  states by  $|D_{1,2}\rangle = p|D^0\rangle + q|\bar{D}^0\rangle$ . See the note on “ $D^0$ - $\bar{D}^0$  Mixing” above.

<sup>1</sup>AAIJ 21AB result comes from analysis of  $D^0 \rightarrow K_S^0\pi^+\pi^-$  events.

<sup>2</sup>AAIJ 19X measurement comes from analysis of  $D^0 \rightarrow K_S^0\pi^+\pi^-$  decays.  $D^0$  come from  $D^{*+}$  and  $\bar{B} \rightarrow D^0\mu^-X$  decays (and c.c.) in  $p\bar{p}$  collisions at 7 and 8 TeV.

<sup>3</sup>Based on 5 fb<sup>-1</sup> of data collected at  $\sqrt{s} = 7, 8, 13$  TeV. Allowing for  $CP$  violation, the direct  $CP$  violation in mixing is reported  $1.00 < |q/p| < 1.35$  at the 68.3% CL for the  $D^0 \rightarrow K^+\pi^-$  and  $\bar{D}^0 \rightarrow K^+\pi^-$ .

<sup>4</sup>The time-dependent Dalitz-plot analysis of  $D^0 \rightarrow K_S^0\pi^+\pi^-$  is employed. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between  $D^0 \rightarrow K^{*+}\pi^-$  and  $\bar{D}^0 \rightarrow K^{*+}\pi^-$ . This value allows  $CP$  violation and is sensitive to the sign of  $\Delta m$ .

<sup>5</sup>Based on 3 fb<sup>-1</sup> of data collected at  $\sqrt{s} = 7, 8$  TeV. Allowing for  $CP$  violation, the direct  $CP$  violation in mixing is reported  $0.75 < |q/p| < 1.24$  at the 68.3% CL for the  $D^0 \rightarrow K^+\pi^-$  and  $\bar{D}^0 \rightarrow K^+\pi^-$ .

<sup>6</sup>The phase of p/q is  $(-14^{+16}_{-18} \pm 5)^\circ$ . The ZHANG 07B value is from the time-dependent Dalitz-plot analysis of  $D^0 \rightarrow K_S^0\pi^+\pi^-$ . Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between  $D^0 \rightarrow K^{*+}\pi^-$  and  $\bar{D}^0 \rightarrow K^{*+}\pi^-$ . This value allows  $CP$  violation.

## $A_\Gamma$

$A_\Gamma$  is the decay-rate asymmetry for  $CP$ -even final states  $A_\Gamma = (\bar{\tau}_+ - \tau_+) / (\bar{\tau}_+ + \tau_+)$ .

See the note on “ $D^0$ - $\bar{D}^0$  Mixing” above.

### $\phi^{K_S^0 \pi\pi}$

Parametrizes  $CP$  violation in the interference between  $D^0$  mixing and decay. The mass eigenstates  $D_1^0$  and  $D_2^0$  are related to the  $C = \pm 1$  states by  $|D_{1,2}\rangle = p|D^0\rangle + q|\overline{D}^0\rangle$ . In the absence of  $CP$  violation in the decay, and using the usual phase convention where  $CP$  conservation implies  $q/p$  is real,  $\phi^{K_S^0 \pi\pi}$  is identical to the decay-mode-independent parameter  $\phi = \arg(q/p)$ .

<sup>1</sup> Uses quantum correlations in  $e^+ e^- \rightarrow D^0 \bar{D}^0$  at the  $\psi(3770)$  to measure the asymmetry of the branching fraction of  $D^0 \rightarrow K^- \pi^+$  in  $CP$ -odd and  $CP$ -even eigenstates to be  $(13.2 \pm 1.1 \pm 0.7)\%$  and  $(13.0 \pm 1.2 \pm 0.8)\%$  when using the predominantly  $CP$ -even tag  $D^0 \rightarrow \pi^+ \pi^- \pi^0$ . A fit that includes external measurements of charm mixing parameters finds the value quoted above.

<sup>2</sup> Uses quantum correlations in  $e^+ e^- \rightarrow D^0 \bar{D}^0$  at the  $\psi(3770)$  to measure the asymmetry of the branching fraction of  $D^0 \rightarrow K^- \pi^+$  in  $CP$ -odd and  $CP$ -even eigenstates to be  $(12.7 \pm 1.3 \pm 0.7)\%$ . A fit that includes external measurements of charm mixing parameters finds the value quoted above.

<sup>3</sup> Uses quantum correlations in  $e^+ e^- \rightarrow D^0 \bar{D}^0$  at the  $\psi(3770)$ , where decay rates of  $CP$ -tagged  $K\pi$  final states depend on the strong phases between the decays of  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ . The measurements obtained  $\sin(\delta) = -0.01 \pm 0.41 \pm 0.04$  and  $|\delta| = (10^{+28}_{-53}{}^{+13}_{-00})^\circ$  as well. A fit that includes external measurements of charm mixing parameters finds  $\cos(\delta) = 1.15^{+0.19}_{-0.17}{}^{+0.00}_{-0.08}$ ,  $\sin(\delta) = 0.56^{+0.32}_{-0.31}{}^{+0.21}_{-0.20}$ , and  $|\delta| = (18^{+11}_{-17})^\circ$ .

<sup>4</sup> ASNER 08 uses quantum correlations in  $e^+ e^- \rightarrow D^0 \bar{D}^0$  at the  $\psi(3770)$ , where decay rates of  $CP$ -tagged  $K\pi$  final states depend on  $\cos \delta$  because of interfering amplitudes. The above measurement implies  $|\delta| < 75^\circ$  with a confidence level of 95%. A fit that includes external measurements of charm mixing parameters finds  $\cos \delta = 1.10 \pm 0.35 \pm 0.07$ . See also the note on “ $D^0 - \bar{D}^0$  Mixing” p. 783 in our 2008 Review (PDG 08).

## $D^0 \rightarrow K^- \pi^+ \pi^0$ COHERENCE FACTOR $R_{K\pi\pi^0}$

See the note on ‘ $D^0 - \bar{D}^0$  Mixing’ for the definition.  $R_{K\pi\pi^0}$  can have any value between 0 and 1. A value near 1 indicates the decay is dominated by a few intermediate states with limited interference.

<b>-16.6±18.4</b>	<sup>1</sup> INSLER	12	CLEO $e^+ e^- \rightarrow D^0 \bar{D}^0$ at 3.77 GeV

<sup>1</sup> Uses quantum correlations in  $e^+ e^- \rightarrow D^0 \bar{D}^0$  at the  $\psi(3770)$ , where the signal side  $D$  decays to  $K_S^0 K \pi$  and the tag-side  $D$  decays to  $K \pi$ ,  $K \pi \pi \pi$ ,  $K \pi \pi^0$ , and 10 additional  $CP$ -even,  $CP$ -odd, and mixed  $CP$  modes involving  $K_S^0$  or  $K_L^0$ .

 **$D^0$  DECAY MODES**

Most decay modes (other than the semileptonic modes) that involve a neutral  $K$  meson are now given as  $K_S^0$  modes, not as  $\bar{K}^0$  modes. Nearly always it is a  $K_S^0$  that is measured, and interference between Cabibbo-allowed and doubly Cabibbo-suppressed modes can invalidate the assumption that  $2\Gamma(K_S^0) = \Gamma(\bar{K}^0)$ .

$\Gamma_{356}$  Unaccounted decay modes

- [a] This value is obtained by subtracting the branching fractions for 2-, 4- and 6-prongs from unity.
  - [b] This is the sum of our  $K^- 2\pi^+ \pi^-$ ,  $K^- 2\pi^+ \pi^- \pi^0$ ,  $\bar{K}^0 2\pi^+ 2\pi^-$ ,  $K^+ 2K^- \pi^+$ ,  $2\pi^+ 2\pi^-$ ,  $2\pi^+ 2\pi^- \pi^0$ ,  $K^+ K^- \pi^+ \pi^-$ , and  $K^+ K^- \pi^+ \pi^- \pi^0$ , branching fractions.
  - [c] This is the sum of our  $K^- 3\pi^+ 2\pi^-$  and  $3\pi^+ 3\pi^-$  branching fractions.
  - [d] The branching fractions for the  $K^- e^+ \nu_e$ ,  $K^*(892)^- e^+ \nu_e$ ,  $\pi^- e^+ \nu_e$ , and  $\rho^- e^+ \nu_e$  modes add up to  $6.17 \pm 0.17$  %.
  - [e] The branching fraction for this mode may differ from the sum of the submodes that contribute to it, due to interference effects. See the relevant papers.
  - [f] This is a doubly Cabibbo-suppressed mode.
  - [g] Submodes of the  $D^0 \rightarrow K_S^0 \pi^+ \pi^- \pi^0$  mode with a  $K^*$  and/or  $\rho$  were studied by COFFMAN 92B, but with only 140 events. With nothing new for 18 years, we refer to our 2008 edition, Physics Letters **B667** 1 (2008), for those results.
  - [h] This branching fraction includes all the decay modes of the resonance in the final state.
  - [i] This limit assumes the average of  $B(D^0 \rightarrow K^- e^+ \nu_e)$  and  $B(D^0 \rightarrow K^- \mu^+ \nu_\mu)$  for the  $B(D^0 \rightarrow K^- \ell^+ \nu_\ell)$  value.
  - [j] This mode is not a useful test for a  $\Delta C=1$  weak neutral current because both quarks must change flavor in this decay.
  - [k] The value is for the sum of the charge states or particle/antiparticle states indicated.
- 

**FIT INFORMATION**

An overall fit to 68 branching ratios uses 134 measurements to determine 33 parameters. The overall fit has a  $\chi^2 = 149.3$  for 101 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ .

## CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 3 measurements and one constraint to determine 4 parameters. The overall fit has a  $\chi^2 = 0.0$  for 0 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$x_2$	-100		
$x_3$	-46	39	
$x_4$	0	0	0
	$x_1$	$x_2$	$x_3$

$4.2 \pm 0.4 \pm 0.4$	0.9k	ADLER	88C	MRK3	$e^+ e^-$ 3.77 GeV
$4.1 \pm 0.6$	0.3k	SCHINDLER <sup>9</sup>	81	MRK2	$e^+ e^-$ 3.771 GeV
$4.3 \pm 1.0$	130	PERUZZI <sup>10</sup>	77	LGW	$e^+ e^-$ 3.77 GeV

<sup>1</sup> ABLIKIM 18W measured the combined  $K^\mp \pi^\pm$  branching fraction to be 3.898%. We have subtracted off the doubly Cabibbo-suppressed branching fraction  $B(D^0 \rightarrow K^+ \pi^-) = (1.50 \pm 0.07) \times 10^{-4}$ , even though it is less than one-third of the uncertainty of the combined measurement, in order to treat this as a measurement of  $B(D^0 \rightarrow K^- \pi^+)$ .

<sup>2</sup> This combines the CLEO results of ARTUSO 98, COAN 98, and AKERIB 93.

<sup>3</sup> ABACHI 88, DECAMP 91J, AKERIB 93, ALBRECHT 94F, and BARATE 97C use  $D^*(2010)^+ \rightarrow D^0 \pi^+$  decays. The  $\pi^+$  is both slow and of low  $p_T$  with respect to the event thrust axis or nearest jet ( $\approx D^{*+}$  direction). The excess number of such  $\pi^+$ 's over background gives the number of  $D^*(2010)^+ \rightarrow D^0 \pi^+$  events, and the fraction with  $D^0 \rightarrow K^- \pi^+$  gives the  $D^0 \rightarrow K^- \pi^+$  branching fraction.

<sup>4</sup> DOBBS 07 and HE 05 use single- and double-tagged events in an overall fit. DOBBS 07 supersedes HE 05.

<sup>5</sup> ARTUSO 98, following ALBRECHT 94, uses  $D^0$  mesons from  $\bar{B}^0 \rightarrow D^*(2010)^+ X \ell^- \bar{\nu}_\ell$  decays. Our average uses the CLEO average of this value with the values of COAN 98 and AKERIB 93.

<sup>6</sup> COAN 98 assumes that  $\Gamma(B \rightarrow \bar{D} X \ell^+ \nu)/\Gamma(B \rightarrow X \ell^+ \nu) = 1.0 - 3|V_{ub}/V_{cb}|^2 - 0.010 \pm 0.005$ , the last term accounting for  $\bar{B} \rightarrow D_s^+ K X \ell^- \bar{\nu}$ . COAN 98 is included in the CLEO average in ARTUSO 98.

<sup>7</sup> ALBRECHT 94 uses  $D^0$  mesons from  $\bar{B}^0 \rightarrow D^{*+} \ell^- \bar{\nu}_\ell$  decays. This is a different set of events than used by ALBRECHT 94F.

<sup>8</sup> This AKERIB 93 value includes radiative corrections; without them, the value is  $0.0391 \pm 0.0008 \pm 0.0017$ . AKERIB 93 is included in the CLEO average in ARTUSO 98.

<sup>9</sup> SCHINDLER 81 (MARK-2) measures  $\sigma(e^+ e^- \rightarrow \psi(3770)) \times$  branching fraction to be  $0.24 \pm 0.02$  nb. We use the MARK-3 (ADLER 88C) value of  $\sigma = 5.8 \pm 0.5 \pm 0.6$  nb.

<sup>10</sup> PERUZZI 77 (MARK-1) measures  $\sigma(e^+ e^- \rightarrow \psi(3770)) \times$  branching fraction to be  $0.25 \pm 0.05$  nb. We use the MARK-3 (ADLER 88C) value of  $\sigma = 5.8 \pm 0.5 \pm 0.6$  nb.

<sup>1</sup> DOBBS 07 and HE 05 use single- and double-tagged events in an overall fit. DOBBS 07 supersedes HE 05.

<sup>2</sup> ALBRECHT 94 uses  $D^0$  mesons from  $\bar{B}^0 \rightarrow D^{*+} \ell^- \bar{\nu}_\ell$  decays. This is a different set of events than used by ALBRECHT 94F.

<sup>3</sup> See the footnote on the ALBRECHT 94F measurement of  $\Gamma(K^- \pi^+)/\Gamma_{\text{total}}$  for the method used.

<sup>4</sup> SCHINDLER 81 (MARK-2) measures  $\sigma(e^+ e^- \rightarrow \psi(3770)) \times$  branching fraction to be  $0.68 \pm 0.11$  nb. We use the MARK-3 (ADLER 88C) value of  $\sigma = 5.8 \pm 0.5 \pm 0.6$  nb.

<sup>5</sup> PERUZZI 77 (MARK-1) measures  $\sigma(e^+ e^- \rightarrow \psi(3770)) \times$  branching fraction to be  $0.36 \pm 0.10$  nb. We use the MARK-3 (ADLER 88C) value of  $\sigma = 5.8 \pm 0.5 \pm 0.6$  nb.

 $\Gamma(K_S^0 \pi^+ \pi^- \pi^0)/\Gamma(K_S^0 \pi^+ \pi^-)$   $\Gamma_{89}/\Gamma_{44}$ 

Branching fractions for submodes of this mode with narrow resonances (the  $\eta$ ,  $\omega$ ,  $\eta'$ ) are fairly well determined (see below). COFFMAN 92B gives fractions of  $K^*$  and  $\rho$  submodes, but with only  $140 \pm 28$  events above background could not determine them with much accuracy. We omit those measurements here; they are in our 2008 Review (Physics Letters **B667** 1 (2008)).

$0.360 \pm 0.037$  1 CAWLFIELD 06A CLEO Dalitz fit,  $627 \pm 30$  evts

<sup>1</sup> The error is statistical only. CAWLFIELD 06A also fits the Dalitz plot replacing this flat nonresonant background with broad  $S$ -wave  $\kappa^\pm \rightarrow K^\pm \pi^0$  resonances. There is no significant improvement in the fit, and  $K^*\pm K^\mp$  and  $\phi \pi^0$  results are not much changed.

## $\Gamma(K^+\pi^-)/\Gamma(K^-\pi^+)$

## $\Gamma_{289}/\Gamma_{38}$

This is  $R$ , the time-integrated wrong-sign rate compared to the right-sign rate. See the note on “ $D^0$ - $\bar{D}^0$  Mixing,” near the start of the  $D^0$  Listings.

The experiments here use the charge of the pion in  $D^*(2010)^\pm \rightarrow (D^0 \text{ or } \bar{D}^0) \pi^\pm$  decay to tell whether a  $D^0$  or a  $\bar{D}^0$  was born. The  $D^0 \rightarrow K^+\pi^-$  decay can occur directly by doubly Cabibbo-suppressed (DCS) decay, or indirectly by  $D^0 \rightarrow \bar{D}^0$  mixing followed by  $\bar{D}^0 \rightarrow K^+\pi^-$  decay. Some of the experiments can use the decay-time information to disentangle the two mechanisms. Here, we list the experimental branching ratio, which if there is no mixing is the DCS ratio. See the next data block for values of the DCS ratio  $R_D$ , and the following data block for limits on the mixing ratio  $R_M$ . See the section on  $CP$ -violating asymmetries near the end of this  $D^0$  Listing for values of  $A_D$ , and the note on “ $D^0$ - $\bar{D}^0$  Mixing” for limits on  $x'$  and  $y'$ .

Some early limits have been omitted from this Listing; see our 1998 edition (The European Physical Journal **C3** 1 (1998)) and our 2006 edition (Journal of Physics **G33** 1 (2006)).

<b><math>3.03 \pm 0.07</math> OUR AVERAGE</b>				
$3.025 \pm 0.077$	42k,11M	<sup>1</sup> AAIJ	16F LHCb	$p p$ at 7, 8 TeV
$3.03 \pm 0.13$		<sup>2</sup> EVANS	16 CLEO	$e^+ e^- \rightarrow D^0 \bar{D}^0$ at $\psi(3770)$

<sup>1</sup> This result uses external input on the mixing parameters x, y. Without this input, the result is  $(3.215 \pm 0.136) \times 10^{-3}$ .

<sup>2</sup> A combined fit with a recent LHCb  $D^0 \bar{D}^0$  mixing results in AAIJ 16F is also reported to be  $(3.01 \pm 0.07) \times 10^{-3}$ .

### $\Gamma(K^+ \pi^+ 2\pi^-)/\Gamma(K^- 2\pi^+ \pi^-)$

### $\Gamma_{300}/\Gamma_{78}$

The experiments here use the charge of the pion in  $D^*(2010)^{\pm} \rightarrow (D^0 \text{ or } \bar{D}^0) \pi^{\pm}$  decay to tell whether a  $D^0$  or a  $\bar{D}^0$  was born. The  $D^0 \rightarrow K^+ \pi^- \pi^+ \pi^-$  decay can occur directly by doubly Cabibbo-suppressed (DCS) decay, or indirectly by  $D^0 \rightarrow \bar{D}^0$  mixing followed by  $\bar{D}^0 \rightarrow K^+ \pi^- \pi^+ \pi^-$  decay. Some of the experiments can use the decay-time information to disentangle the two mechanisms. Here, we list the experimental branching ratio, which if there is no mixing is the DCS ratio; in the next data block we give the limits on the mixing ratio.

Some early limits have been omitted from this Listing; see our 1998 edition (EPJ **C3** 1).

<18	90		<sup>2</sup> AMMAR	91	CLEO $e^+ e^- \approx 10.5$ GeV
<18	90		<sup>4</sup> ANJOS	88C	E691 Photoproduction

<sup>1</sup> AAIJ 16F result comes from time-dependent analysis that uses external input on the mixing parameters x, y. Without this input, the result is  $(3.29 \pm 0.08) \times 10^{-3}$ .

<sup>2</sup> AMMAR 91 cannot and DYTMAN 01, TIAN 05 do not distinguish between doubly Cabibbo-suppressed decay and  $D^0\bar{D}^0$  mixing.

<sup>3</sup> This AITALA 98 result assumes no  $D^0\bar{D}^0$  mixing ( $R_M$  in the note on “ $D^0\bar{D}^0$  Mixing”). It becomes  $-0.0020^{+0.0117}_{-0.0106} \pm 0.0035$  when mixing is allowed and decay-time information is used to distinguish doubly Cabibbo-suppressed decays from mixing.

<sup>4</sup> ANJOS 88C uses decay-time information to distinguish doubly Cabibbo-suppressed (DCS) decays from  $D^0\bar{D}^0$  mixing. However, the result assumes no interference between the DCS and mixing amplitudes ( $y' = 0$  in the note on “ $D^0\bar{D}^0$  Mixing” near the start of the  $D^0$  Listings). When interference is allowed, the limit degrades to 0.033.

### $\Gamma(K^+\pi^+2\pi^- \text{ via } \bar{D}^0)/\Gamma(K^-\pi^+\pi^-)$

### $\Gamma_{301}/\Gamma_{78}$

This is a  $D^0\bar{D}^0$  mixing limit. The experiments here (1) use the charge of the pion in  $D^*(2010)^\pm \rightarrow (D^0 \text{ or } \bar{D}^0) \pi^\pm$  decay to tell whether a  $D^0$  or a  $\bar{D}^0$  was born; and (2) use the decay-time distribution to disentangle doubly Cabibbo-suppressed decay and mixing. For the limits on  $|m_{D_1^0} - m_{D_2^0}|$  and  $(\Gamma_{D_1^0} - \Gamma_{D_2^0})/\Gamma_{D^0}$  that come from the best mixing limit, see near the beginning of these  $D^0$  Listings.

<b>• • •</b> We do not use the following data for averages, fits, limits, etc. <b>• • •</b>				
<0.0085	90	<sup>1</sup> AITALA	98	E791 $\pi^-$ nucleus, 500 GeV
<0.0037	90	<sup>2</sup> ANJOS	88C	E691 Photoproduction

<sup>1</sup> AITALA 98 uses decay-time information to distinguish doubly Cabibbo-suppressed decays from  $D^0$ - $\bar{D}^0$  mixing. The fit allows interference between the two amplitudes, and also allows  $CP$  violation in this term. The central value obtained is  $0.0039^{+0.0036}_{-0.0032} \pm 0.0016$ . When interference is disallowed, the result becomes  $0.0021 \pm 0.0009 \pm 0.0002$ .

<sup>2</sup> This combines results of ANJOS 88C on  $K^+\pi^-$  and  $K^+\pi^-\pi^+\pi^-$  (via  $\bar{D}^0$ ) reported in the data block above (see footnotes there). It assumes no interference.

 $\Gamma(\mu^- \text{ anything via } \bar{D}^0)/\Gamma(\mu^+ \text{ anything})$   $\Gamma_{303}/\Gamma_6$ 

This is a  $D^0$ - $\bar{D}^0$  mixing limit. See the somewhat better limits above.

$4.0 \pm 0.5 \pm 0.2 \pm 0.1$	68	1,2 LEES	19A BABR	$e^+ e^-$ near $\gamma(4S)$

<sup>1</sup> Observation with  $9.7 \sigma$  significance. The last uncertainty is due to the uncertainty on the branching fraction of the normalization mode,  $D^0 \rightarrow K^- \pi^+ \pi^+ \pi^-$ . The second uncertainty is other systematic and is dominated by the model parameterization.

<sup>2</sup> LEES 19A also sets an upper limit for non-resonant regions, where long-distance effects are expected to be small:  $< 3.1 \times 10^{-6}$  at 90% CL.

$\Gamma(K^-\pi^+e^+e^-,\text{1.005} < m_{ee} < \text{1.035 GeV})/\Gamma_{\text{total}}$   $\Gamma_{328}/\Gamma$

 **$D^0$  CP-EVEN FRACTIONS**

The  $CP$ -even fraction  $F_+$ , defined for self-conjugate final states, like the coherence factor is useful for measuring the unitary triangle angle  $\gamma$  in  $B \rightarrow DK$  decays. A purely  $CP$ -even state has  $F_+ = 1$ , a  $CP$ -odd one has  $F_+ = 0$ . For details, see NAYAK 15.

 **$CP$ -even fraction in  $D^0 \rightarrow K_S^0 \pi^+ \pi^- \pi^0$  decays**

<sup>1</sup> A combined measurement of the  $CP$ -even fraction using both  $CP$  tags and  $K_{S,L}^0 \pi^+ \pi^-$  tags. ABLIKIM 23AJ reports  $CP$ -even fractions  $0.704 \pm 0.042 \pm 0.028$  and  $0.798 \pm 0.077 \pm 0.019$  for the former and latter tags, respectively.

<sup>2</sup> Obtained by analyzing CLEO data but not authored by the CLEO Collaboration.

 **$D^0$  CP-VIOLATING DECAY-RATE ASYMMETRIES**

This is the difference between  $D^0$  and  $\bar{D}^0$  partial widths for the decay to state  $f$ , divided by the sum of the widths:

$$A_{CP}(f) = [\Gamma(D^0 \rightarrow f) - \Gamma(\bar{D}^0 \rightarrow \bar{f})] / [\Gamma(D^0 \rightarrow f) + \Gamma(\bar{D}^0 \rightarrow \bar{f})].$$

 **$A_{CP}(K^+ K^-)$  in  $D^0, \bar{D}^0 \rightarrow K^+ K^-$**

–  $6 \pm 15 \pm 10$     1.8M    <sup>2</sup> AAIJ    14AK LHCb See AAIJ 17M

<sup>1</sup> AAIJ 23AC result comes from  $5.7 \text{ fb}^{-1}$  of data. Also reports the values of the direct  $CP$  asymmetries,  $a_{\pi\pi}^{CP} = (23.2 \pm 6.1) \times 10^{-4}$  and  $a_{KK}^{CP} = (7.7 \pm 5.7) \times 10^{-4}$ , with a correlation of 88%, obtained using previous determinations of  $A_{CP}(KK)$ ,  $\Delta A_{CP}$ ,  $\Delta Y$ , the reconstructed mean decay times of  $D^0 \rightarrow \pi\pi$  and  $D^0 \rightarrow KK$  in the aforementioned measurements, and the world average of the  $D^0$  lifetime (PDG 22).

<sup>2</sup> See also " $D^0$   $CP$ -violating asymmetry differences" at the end of the  $CP$ -violating asymmetries.

<sup>3</sup> AUBERT 08M uses corrected numbers of events directly, not ratios with  $K^\mp\pi^\pm$  events.

<sup>4</sup> STARIC 08 uses  $D^0 \rightarrow K^-\pi^+$  and  $\bar{D}^0 \rightarrow K^+\pi^-$  decays to correct for detector-induced asymmetries.

<sup>5</sup> AITALA 98C, LINK 00B, CSORNA 02, and ACOSTA 05C measure  $N(D^0 \rightarrow K^+K^-)/N(D^0 \rightarrow K^-\pi^+)$ , the ratio of numbers of events observed, and similarly for the  $\bar{D}^0$ .

<sup>1</sup> Based on 3 fb<sup>-1</sup> of data collected at  $\sqrt{s} = 7, 8$  TeV. Allowing for  $CP$  violation, the direct  $CP$ -violation in mixing is reported for the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^- \pi^+$ .

<sup>2</sup> The  $CPV$  is derived from  $A_{CP} = (R_D^+ - R_D^-)/(R_D^+ + R_D^-)$ .

<sup>3</sup> This ZHANG 06 result allows mixing.

<sup>4</sup> This LINK 05H result assumes no mixing. If mixing is allowed, it becomes  $0.13^{+0.33}_{-0.25} \pm 0.10$ .

<sup>5</sup> This AUBERT 03z limit assumes no mixing. If mixing is allowed, the 95% confidence-level interval is  $(-2.8 < A_D < 4.9) \times 10^{-3}$ .

<sup>6</sup> This GODANG 00 result assumes no  $D^0$ - $\bar{D}^0$  mixing and becomes  $-0.43 < A_{CP} < +0.34$  at 95% CL. If mixing is allowed  $A_{CP} = -0.01^{+0.16}_{-0.17} \pm 0.01$ .

<sup>7</sup> This LI 05A result allows mixing.

## $D^0$ CP-VIOLATING ASYMMETRY DIFFERENCES

$$\Delta A_{CP} = A_{CP}(K^+ K^-) - A_{CP}(\pi^+ \pi^-)$$

$CP$  violation in these modes can come from the decay amplitudes (direct) and/or from mixing or interference of mixing and decay (indirect). The difference  $\Delta A_{CP}$  is primarily sensitive to the direct component, and only retains a second-order dependence on the indirect component for measurements where the mean decay time of the  $K^+ K^-$  and  $\pi^+ \pi^-$  samples are not identical. The results below are averaged assuming the indirect component can be neglected.

## $D^0$ TESTS OF LOCAL CP-VIOLATION (CPV)

We list model-independent searches for local  $CP$  violation in phase-space distributions of multi-body decays.

Most of these searches divide phase space (Dalitz plot for 3-body decays, five-dimensional equivalent for 4-body decays) into bins, and perform a  $\chi^2$  test comparing normalised yields  $N_i, \bar{N}_i$  in  $CP$ -conjugate bin pairs  $i$ :  $\chi^2 = \sum_i (N_i - \alpha \bar{N}_i)/\sigma(N_i - \alpha \bar{N}_i)$ . The factor  $\alpha = (\sum_i N_i)/(\sum_i \bar{N}_i)$  removes the dependence on phase-space-integrated rate asymmetries. The result is used to obtain the probability (p-value) to obtain the measured  $\chi^2$  or larger under the assumption of  $CP$  conservation [AUBERT 08A0, BEDIAGA 09]. Alternative methods obtain p-values from other test variables based on unbinned analyses [WILLIAMS 11, AAIJ 14C]. Results can be combined using Fisher's method [MOSTELLER 48].

## CP VIOLATING ASYMMETRIES OF P-ODD (T-ODD) MOMENTS

The CP-sensitive P-odd (T-odd) correlation in  $D^0, \bar{D}^0$  decays. The  $D^0$  and  $\bar{D}^0$  are distinguished by the charge of the parent  $D^*$ :  $D^{*+} \rightarrow D^0 \pi^+$  and  $D^{*-} \rightarrow \bar{D}^0 \pi^-$ .

### $A_{T\text{viol}}(K^+ K^- \pi^+ \pi^-)$ in $D^0, \bar{D}^0 \rightarrow K^+ K^- \pi^+ \pi^-$

$C_T \equiv \vec{p}_{K^+} \cdot (\vec{p}_{\pi^+} \times \vec{p}_{\pi^-})$  is a parity-odd correlation of the  $K^+$ ,  $\pi^+$ , and  $\pi^-$  momenta (evaluated in the  $D^0$  rest frame) for the  $D^0$ .  $\bar{C}_T \equiv \vec{p}_{K^-} \cdot (\vec{p}_{\pi^-} \times \vec{p}_{\pi^+})$  is the corresponding quantity for the  $\bar{D}^0$ . Then

$A_T \equiv [\Gamma(C_T > 0) - \Gamma(C_T < 0)] / [\Gamma(C_T > 0) + \Gamma(C_T < 0)]$ , and

$\bar{A}_T \equiv [\Gamma(-\bar{C}_T > 0) - \Gamma(-\bar{C}_T < 0)] / [\Gamma(-\bar{C}_T > 0) + \Gamma(-\bar{C}_T < 0)]$ , and

$A_{T\text{viol}} \equiv \frac{1}{2}(A_T - \bar{A}_T)$ .  $C_T$  and  $\bar{C}_T$  are commonly referred to as T-odd moments, because they are odd under T reversal. However, the T-conjugate process  $K^+ K^- \pi^+ \pi^- \rightarrow D^0$  is not accessible, while the CP-conjugate process is.

<sup>1</sup>KIM 19 also study  $CP$ -violating asymmetries in several other kinematic variables. No evidence for  $CP$  violation is found in any of them.

### $A_{T\text{viol}}(2K_S^0\pi^+\pi^-)$ in $D^0, \bar{D}^0 \rightarrow 2K_S^0\pi^+\pi^-$

$C_T \equiv \vec{p}_{K_S^0} \cdot (\vec{p}_{\pi^+} \times \vec{p}_{\pi^-})$  is a parity-odd correlation of the  $K_S^0$  (with higher momentum),  $\pi^+$ , and  $\pi^-$  momenta (evaluated in the  $D^0$  rest frame) for the  $D^0$ .  $\bar{C}_T \equiv \vec{p}_{K_S^0} \cdot (\vec{p}_{\pi^-} \times \vec{p}_{\pi^+})$  is the corresponding quantity for the  $\bar{D}^0$ . Then

$A_T \equiv [\Gamma(C_T > 0) - \Gamma(C_T < 0)] / [\Gamma(C_T > 0) + \Gamma(C_T < 0)]$ , and  
 $\bar{A}_T \equiv [\Gamma(-\bar{C}_T > 0) - \Gamma(-\bar{C}_T < 0)] / [\Gamma(-\bar{C}_T > 0) + \Gamma(-\bar{C}_T < 0)]$ , and

$A_{T\text{viol}} \equiv \frac{1}{2}(A_T - \bar{A}_T)$ .  $C_T$  and  $\bar{C}_T$  are commonly referred to as  $T$ -odd moments, because they are odd under  $T$  reversal. However, the  $T$ -conjugate process  $K_S^0 K_S^0 \pi^+ \pi^- \rightarrow D^0$  is not accessible, while the  $CP$ -conjugate process is.

VALUE (units $10^{-2}$ )	EVTS	DOCUMENT ID	TECN	COMMENT
<b><math>-1.95 \pm 1.42^{+0.14}_{-0.12}</math></b>	6095	SANGAL	23	BELL $e^+ e^-$ at $\gamma(4S, 5S)$ , 10.520 GeV

### $A_{T\text{viol}}(K_S^0\pi^+\pi^-\pi^0)$ in $D^0, \bar{D}^0 \rightarrow K_S^0\pi^+\pi^-\pi^0$

$C_T \equiv \vec{p}_{K_S^0} \cdot (\vec{p}_{\pi^+} \times \vec{p}_{\pi^-})$  is a parity-odd correlation evaluated in the  $D^0$  rest frame.

$\bar{C}_T$  is defined as the  $CP$ -conjugate observable with  $\bar{D}^0$  daughter particles. Then

$A_T \equiv [\Gamma(C_T > 0) - \Gamma(C_T < 0)] / [\Gamma(C_T > 0) + \Gamma(C_T < 0)]$ , and  
 $\bar{A}_T \equiv [\Gamma(-\bar{C}_T > 0) - \Gamma(-\bar{C}_T < 0)] / [\Gamma(-\bar{C}_T > 0) + \Gamma(-\bar{C}_T < 0)]$ , and

$A_{T\text{viol}} \equiv \frac{1}{2}(A_T - \bar{A}_T)$ .  $C_T$  and  $\bar{C}_T$  are commonly referred to as  $T$ -odd moments, because they are odd under  $T$  reversal. However, the  $T$ -conjugate process  $K_S^0 \pi^+ \pi^- \pi^0 \rightarrow D^0$  is not accessible, while the  $CP$ -conjugate process is.

VALUE (units $10^{-3}$ )	EVTS	DOCUMENT ID	TECN	COMMENT
<b><math>-0.28 \pm 1.38^{+0.23}_{-0.76}</math></b>	745k	<sup>1</sup> PRASANTH	17	BELL $e^+ e^-$ at $\gamma(nS)$ 's

<sup>1</sup>PRASANTH 17 also measures  $A_{T\text{viol}}$  in sub-regions of the  $D^0 \rightarrow K_S^0 \pi^+ \pi^- \pi^0$  phase-space. No evidence of  $T$  violation is found.

## $D^0$ CPT-VIOLATING DECAY-RATE ASYMMETRIES

### $A_{CPT}(K^\mp\pi^\pm)$ in $D^0 \rightarrow K^-\pi^+, \bar{D}^0 \rightarrow K^+\pi^-$

$A_{CPT}(t)$  is defined in terms of the time-dependent decay probabilities  $P(D^0 \rightarrow K^-\pi^+)$  and  $\bar{P}(\bar{D}^0 \rightarrow K^+\pi^-)$  by  $A_{CPT}(t) = (\bar{P} - P)/(\bar{P} + P)$ . For small mixing parameters  $x \equiv \Delta m/\Gamma$  and  $y \equiv \Delta\Gamma/2\Gamma$  (as is the case), and times  $t$ ,  $A_{CPT}(t)$  reduces to  $[y \operatorname{Re} \xi - x \operatorname{Im} \xi] \Gamma t$ , where  $\xi$  is the  $CPT$ -violating parameter.

The following is actually  $y \operatorname{Re} \xi - x \operatorname{Im} \xi$ .

## Amplitude analyses

### $D \rightarrow K\pi\pi\pi$ , $D \rightarrow KK\pi\pi$ partial wave analyses

Amplitude analyses of  $D^0$  decays to a variety of 4-body kaon or pion final states, fitting simultaneously different partial wave components.
