---

***n* MEAN LIFE**

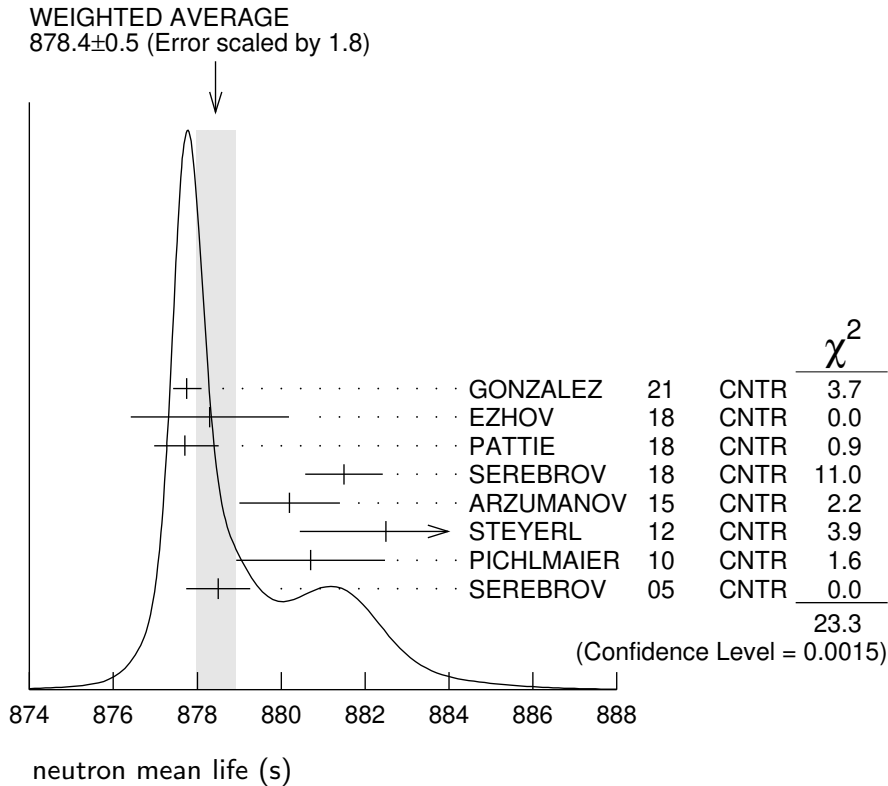

Limits on lifetimes for *bound* neutrons are given in the section “p PARTIAL MEAN LIVES.”

We average eight of the best nine measurements, those made with ultra-cold neutrons (UCN's). If we include the one in-beam measurement with a comparable error (YUE 13), we get  $878.6 \pm 0.6$  s, where the scale factor is now 2.2.

For a recent discussion of the long-standing disagreement between in-beam and UCN results, see CZARNECKI 18 (Physical Review Letters **120** 202002 (2018)). For a full review of all matters concerning the neutron lifetime until about 2010, see WIETFELDT 11, F.E. Wietfeldt and G.L. Greene, “The neutron lifetime,” Reviews of Modern Physics **83** 1173 (2011).

- <sup>1</sup> PATTIE 18 uses a new technique, with a semi-toroidal magneto-gravitational asymmetric trap and a novel in situ  $n$ -detector.
- <sup>2</sup> ARZUMANOV 15 is a reanalysis of their 2008–2010 dataset, with improved systematic corrections of of ARZUMANOV 00 and ARZUMANOV 12.
- <sup>3</sup> STEYERL 12 is a detailed reanalysis of neutron storage loss corrections to the raw data of MAMPE 89, and it replaces that value.
- <sup>4</sup> WILSON 21 extract the value from the flux of  $n$  escaping the moon using data from the Lunar Prospector Neutron Spectrometer.
- <sup>5</sup> YUE 13 differs from NICO 05 in that a different and better method was used to measure the neutron density in the fiducial volume. This shifted the lifetime by +1.4 seconds and reduced the previously largest source of systematic uncertainty by a factor of five.
- <sup>6</sup> ARZUMANOV 12 reanalyzes its systematic corrections in ARZUMANOV 00 and obtains this corrected value.
- <sup>7</sup> IGNATOVICH 95 calls into question some of the corrections and averaging procedures used by MAMPE 93. The response, BONDARENKO 96, denies the validity of the criticisms.
- <sup>8</sup> The NESVIZHEVSKII 92 measurement has been withdrawn by A. Serebrov.
- <sup>9</sup> The BYRNE 80 measurement has been withdrawn (J. Byrne, private communication, 1990).

## $n$ MAGNETIC MOMENT

See the “Quark Model” review.

VALUE ( $\mu_N$ )	DOCUMENT ID	TECN	COMMENT
<b><math>-1.91304273 \pm 0.00000045</math></b>	TIESINGA	21	RVUE 2018 CODATA value

• • • We do not use the following data for averages, fits, limits, etc. • • •

$-1.91304273 \pm 0.00000045$	MOHR	16	RVUE	2014 CODATA value
$-1.91304272 \pm 0.00000045$	MOHR	12	RVUE	2010 CODATA value
$-1.91304273 \pm 0.00000045$	MOHR	08	RVUE	2006 CODATA value
$-1.91304273 \pm 0.00000045$	MOHR	05	RVUE	2002 CODATA value
$-1.91304272 \pm 0.00000045$	MOHR	99	RVUE	1998 CODATA value

< 16	90	ALTAREV 79	MRS	$d = (4.0 \pm 7.5) \times 10^{-25}$

<sup>1</sup> ABEL 20 reports  $d = (0.0 \pm 1.1 \pm 0.2) \times 10^{-26}$  e cm value corresponding to the listed limit.

<sup>2</sup> SAHOO 17 develops theory to calculate this limit from the measured limit by GRANER 16 of the <sup>199</sup>Hg atom EDM.

<sup>3</sup> PENDLEBURY 15 reports  $d = (-0.21 \pm 1.82) \times 10^{-26}$  e cm value corresponding to the listed limit.

<sup>4</sup> SEREBROV 14 includes the data of ALTAREV 96.

<sup>5</sup> LAMOREAUX 07 faults BAKER 06 for not including in the estimate of systematic error an effect due to the Earth's rotation. BAKER 07 replies (1) that the effect was included implicitly in the analysis and (2) that further analysis confirms that the BAKER 06 limit is correct as is. See also SILENKO 07.

<sup>6</sup> This HARRIS 99 result includes the result of SMITH 90. However, the averaging of the results of these two experiments has been criticized by LAMOREAUX 00.

## $n$ MEAN-SQUARE CHARGE RADIUS

The mean-square charge radius of the neutron,  $\langle r_n^2 \rangle$ , is related to the neutron-electron scattering length  $b_{ne}$  by  $\langle r_n^2 \rangle = 3(m_e a_0 / m_n) b_{ne}$ , where  $m_e$  and  $m_n$  are the masses of the electron and neutron, and  $a_0$  is the Bohr radius. Numerically,  $\langle r_n^2 \rangle = 86.34 b_{ne}$ , if we use  $a_0$  for a nucleus with infinite mass.

8 ± 10	KOESTER	88	CNTR $n$ Pb, $n$ Bi transmission
12 ± 10	SCHMIEDM...	88	CNTR $n$ Pb, $n$ C transmission

<sup>1</sup> KOSSERT 03 gets  $\alpha_n - \beta_n = (9.8 \pm 3.6 \begin{smallmatrix} +2.1 \\ -1.1 \end{smallmatrix} \pm 2.2) \times 10^{-4} \text{ fm}^3$ , and uses  $\alpha_n + \beta_n = (15.2 \pm 0.5) \times 10^{-4} \text{ fm}^3$  from LEVCHUK 00. Thus the errors on  $\alpha_n$  and  $\beta_n$  are anti-correlated.

<sup>2</sup> LUNDIN 03 measures  $\alpha_N - \beta_N = (6.4 \pm 2.4) \times 10^{-4} \text{ fm}^3$  and uses accurate values for  $\alpha_p$  and  $\alpha_p$  and a precise sum-rule result for  $\alpha_n + \beta_n$ . The second error is a model uncertainty, and errors on  $\alpha_n$  and  $\beta_n$  are anticorrelated. The data from this paper are included in the analysis of MYERS 14.

<sup>3</sup> KOLB 00 obtains this value with a lower limit of  $7.6 \times 10^{-4} \text{ fm}^3$  but no upper limit from this experiment alone. Combined with results of ROSE 90, the  $1\text{-}\sigma$  range is  $(7.6\text{--}14.0) \times 10^{-4} \text{ fm}^3$ .

<sup>4</sup> KOESTER 95 uses natural Pb and the isotopes 208, 207, and 206. See this paper for a discussion of methods used by various groups to extract  $\alpha_n$  from data.

<sup>1</sup> KOSSERT 03 gets $\alpha_n - \beta_n = (9.8 \pm 3.6 \begin{smallmatrix} +2.1 \\ -1.1 \end{smallmatrix} \pm 2.2) \times 10^{-4} \text{ fm}^3$ , and uses $\alpha_n + \beta_n = (15.2 \pm 0.5) \times 10^{-4} \text{ fm}^3$ from LEVCHUK 00. Thus the errors on $\alpha_n$ and $\beta_n$ are anti-correlated.			
<sup>2</sup> LUNDIN 03 measures $\alpha_N - \beta_N = (6.4 \pm 2.4) \times 10^{-4} \text{ fm}^3$ and uses accurate values for $\alpha_p$ and $\alpha_p$ and a precise sum-rule result for $\alpha_n + \beta_n$ . The second error is a model uncertainty, and errors on $\alpha_n$ and $\beta_n$ are anticorrelated.			
<sup>3</sup> KOLB 00 obtains this value with an upper limit of $7.6 \times 10^{-4} \text{ fm}^3$ but no lower limit from this experiment alone. Combined with results of ROSE 90, the $1\text{-}\sigma$ range is $(1.2\text{--}7.6) \times 10^{-4} \text{ fm}^3$ .			

## $n$ CHARGE

See also “ $|q_p + q_e|/e$ ” in the proton Listings.

<sup>1</sup> As a limit, this BRESSI 11 value is  $< 1 \times 10^{-21} e$ .  
<sup>2</sup> The BAUMANN 88 error  $\pm 1.1$  gives the 68% CL limits about the the value  $-0.4$ .  
<sup>3</sup> The GAEHLER 82 error  $\pm 22$  gives the 90% CL limits about the the value  $-15$ .

## LIMIT ON $n\bar{n}$ OSCILLATIONS

### Mean Time for $n\bar{n}$ Transition

A test of  $\Delta B=2$  baryon number nonconservation. MOHAPATRA 80 and MOHAPATRA 89 discuss the theoretical motivations for looking for  $n\bar{n}$  oscillations. DOVER 83 and DOVER 85 give phenomenological analyses. The best limits come from looking for the decay of neutrons bound in nuclei. However, these analyses require model-dependent corrections for nuclear effects. See KABIR 83, DOVER 89, ALBERICO 91, and GAL 00 for discussions. Direct searches for  $n \rightarrow \bar{n}$  transitions using reactor neutrons are cleaner but give somewhat poorer limits. We include limits for both free and bound neutrons in the Summary Table. See MOHAPATRA 09 and PHILLIPS 16 for recent reviews.

<sup>1</sup> ABE 21 supersedes ABE 15C.<sup>2</sup> The AHARMIM 17 value is an unbounded limit (it does not assume a positive lifetime). The bounded limit is  $1.23 \times 10^8$  sec.

## LIMIT ON $nn'$ OSCILLATIONS

Lee and Yang (LEE 56) proposed the existence of mirror world in an attempt to restore global parity symmetry. A possible candidate for dark matter. Limits depend on assumptions about fields  $B$  and  $B'$ . See the papers for details. See BEREZHIANI 18 for a recent discussion.

>414	90	SEREBROV	08	CNTR UCN, $B$ field on & off
>103	95	BAN	07	CNTR UCN, $B$ field on & off

<sup>1</sup> BAN 23 determine limits on the oscillation time for the  $|\delta m(nn')|$  range of 2–59 peV. The quoted value is  $\tau_{nn'}/\sqrt{\cos(\beta)} > 1$  sec. for  $B$  in 30–1143  $\mu$ T, for the case  $\beta = 0$ .

<sup>2</sup> ALMAZAN 22 reports an experimental constraint on the probability for neutron conversion into a hidden neutron,  $p < 3.1 \times 10^{-11}$  at 95% CL, which may be used to set a limit on the  $nn'$  oscillation time.

<sup>3</sup> ABEL 21 determine several limits on the oscillation time as a function of the mirror magnetic field  $B'$ , and of the fixed angle,  $\beta$ , between the applied magnetic field and  $B'$ . The latter is assumed to be bound to Earth. Two values are quoted from two analysis methods: (i)  $\tau_{nn'}/\sqrt{\cos(\beta)} > 9$  sec for  $B'$  in 5–25.4  $\mu$ T, and (ii) for any angle  $\beta$ ,  $\tau_{nn'} > 6$  sec for  $B'$  in 0.4–25.7  $\mu$ T. The authors also quote a limit of 352 sec for the case  $B' = 0$  T.

<sup>4</sup> The  $B$  field was set to (0.09, 0.12, 0.21) G. Limits on oscillation time are valid for any mirror field  $B'$  in (0.08–0.17) G, and for aligned fields  $B$  and  $B'$ . For larger values of  $B'$ , the limits are significantly reduced.

<sup>5</sup> Losses of neutrons due to oscillations to mirror neutrons would be maximal when the magnetic fields  $B$  and  $B'$  in the two worlds were equal. Hence the scan over  $B$  by ALTAREV 09A: the limit applies for any  $B'$  over the given range. At  $B' = 0$ , the limit is 141 s (95% CL).

## $n$ DECAY MODES

$$\lambda \equiv g_A / g_V$$

- <sup>1</sup> HASSAN 21 include earlier data of DARIUS 17. The value is extracted from the angular correlation coefficient  $a$ .
- <sup>2</sup> BECK 20 calculates this value from the measurement of the  $\beta$ -decay  $e\bar{\nu}_e$  angular correlation coefficient  $a$ .
- <sup>3</sup> MAERKISCH 19 gets  $A = -0.11985 \pm 0.00017 \pm 0.00012$ .
- <sup>4</sup> BROWN 18 gets  $A = -0.12054 \pm 0.00044 \pm 0.00068$  and  $\lambda = -1.2783 \pm 0.0022$ . We quote the combined values that include the earlier UCNA measurements (MENDENHALL 13).
- <sup>5</sup> This MUND 13 value includes earlier PERKEO II measurements (ABELE 02 and ABELE 97D).
- <sup>6</sup> MOSTOVOI 01 measures the two  $P$ -odd correlations  $A$  and  $B$ , or rather  $SA$  and  $SB$ , where  $S$  is the  $n$  polarization, in free neutron decay.
- <sup>7</sup> YEROZOLIMSKY 97 makes a correction to the EROZOLIMSKII 91 value.
- <sup>8</sup> SAUL 20 quote this value of  $\lambda$  under the SM assumption of the Fierz term  $b = 0$ . In a combined fit authors extract a value of  $\lambda = -1.2792 \pm 0.0060$ .
- <sup>9</sup> DARIUS 17 calculates this value from the measurement of the  $a$  parameter (see below). Data is included in HASSAN 21.
- <sup>10</sup> MENDENHALL 13 gets  $A = -0.11954 \pm 0.00055 \pm 0.00098$  and  $\lambda = -1.2756 \pm 0.0030$ . We quote the nearly identical values that include the earlier UCNA measurement (PLASTER 12), with a correction to that result.

- <sup>11</sup> This PLASTER 12 value is identical with that given in LIU 10, but the experiment is now described in detail.  
<sup>12</sup> This is the combined result of ABELE 02 and ABELE 97D.  
<sup>13</sup> These experiments measure the absolute value of  $g_A/g_V$  only.  
<sup>14</sup> KROHN 75 includes events of CHRISTENSEN 70.  
<sup>15</sup> KROPF 74 reviews all data through 1972.

## $e^-$ ASYMMETRY PARAMETER $A$

This is the neutron-spin electron-momentum correlation coefficient. Unless otherwise noted, the values are corrected for radiative effects and weak magnetism. In the Standard Model,  $A$  is related to  $\lambda \equiv g_A/g_V$  by  $A = -2 \lambda (\lambda + 1) / (1 + 3\lambda^2)$ ; this assumes that  $g_A$  and  $g_V$  are real.

- <sup>1</sup> MAERKISCH 19 further derive a value for the CKM-element  $|V_{ud}| = 0.97351 \pm 0.00060$ , using  $\tau_n = 879.7(8)$  sec and the relation from CZARNECKI 18.  
<sup>2</sup> BROWN 18 gets  $A = -0.12054 \pm 0.00044 \pm 0.00068$  and  $\lambda = -1.2783 \pm 0.0022$ . We quote the combined values that include the earlier UCNA measurements (MENDENHALL 13).  
<sup>3</sup> This MUND 13 value includes earlier PERKEO II measurements (ABELE 02 and ABELE 97D), with a correction to those results.  
<sup>4</sup> YEROZOLIMSKY 97 makes a correction to the EROZOLIMSKII 91 value.  
<sup>5</sup> Under the SM assumption that the Fierz term  $b = 0$ , SAUL 20 obtain the quoted asymmetry parameter  $A$  and  $\lambda = -1.27607 \pm 0.00068$ . In a combined fit authors extract the values  $A = -0.1209 \pm 0.0015$ ,  $\lambda = -1.2792 \pm 0.0060$ , and  $b = 0.017 \pm 0.021$ .  
<sup>6</sup> MENDENHALL 13 gets  $A = -0.11954 \pm 0.00055 \pm 0.00098$  and  $\lambda = -1.2756 \pm 0.0030$ . We quote the nearly identical values that include the earlier UCNA measurement (PLASTER 12), with a correction to that result.  
<sup>7</sup> This PLASTER 12 value is identical with that given in LIU 10, but the experiment is now described in detail.  
<sup>8</sup> This is the combined result of ABELE 02 and ABELE 97D.

- <sup>9</sup> MOSTOVOI 01 calculates this from its measurement of  $\lambda=g_A/g_V$  above.  
<sup>10</sup> These results are not corrected for radiative effects and weak magnetism, but the corrections are small compared to the errors.

### $\bar{\nu}_e$ ASYMMETRY PARAMETER $B$

This is the neutron-spin antineutrino-momentum correlation coefficient. In the Standard Model,  $B$  is related to  $\lambda \equiv g_A/g_V$  by  $B = 2\lambda(\lambda - 1) / (1 + 3\lambda^2)$ ; this assumes that  $g_A$  and  $g_V$  are real.

$0.9876 \pm 0.0004$	<sup>1</sup> MOSTOVOI 01	CNTR	Inferred

<sup>1</sup> MOSTOVOI 01 calculates this from its measurement of  $\lambda=g_A/g_V$  above.

### PROTON ASYMMETRY PARAMETER $C$

Describes the correlation between the neutron spin and the proton momentum. In the Standard Model,  $C$  is related to  $\lambda \equiv g_A/g_V$  by  $C = -x_c (A + B) = x_c 4\lambda / (1 + 3\lambda^2)$ , where  $x_c = 0.27484$  is a kinematic factor; this assumes that  $g_A$  and  $g_V$  are real.

VALUE	DOCUMENT ID	TECN	COMMENT
<b><math>-0.2377 \pm 0.0010 \pm 0.0024</math></b>	SCHUMANN 08	CNTR	Cold $n$ , polarized

**$e\bar{\nu}_e$  ANGULAR CORRELATION COEFFICIENT  $a$** 

For a review of past experiments and plans for future measurements of the  $a$  parameter, see WIETFELDT 05. In the Standard Model,  $a$  is related to  $\lambda \equiv g_A/g_V$  by  $a = (1 - \lambda^2) / (1 + 3\lambda^2)$ ; this assumes that  $g_A$  and  $g_V$  are real.

VALUE	DOCUMENT ID	TECN	COMMENT
<b>-0.1049 ± 0.0013 OUR AVERAGE</b>	Error includes scale factor of 1.8.

-0.1090 ± 0.0030 ± 0.0028	<sup>2</sup> DARIUS 17	SPEC	Cold $n$ , unpolarized
-0.1045 ± 0.0014	<sup>3</sup> MOSTOVOI 01	CNTR	Inferred

<sup>1</sup> The result of HASSAN 21 includes the data of DARIUS 17, and thus supersedes those entries. HASSAN 21 uses the asymmetry in time-of-flight between the beta electron and recoil proton in delayed coincidence.

<sup>2</sup> DARIUS 17 exploits a "wishbone" correlation, where the  $p$  time of flight is correlated with the momentum of the electron in delayed coincidence. Data is included in HASSAN 21.

<sup>3</sup> MOSTOVOI 01 calculates this from its measurement of  $\lambda = g_A/g_V$  above.

 **$\phi_{AV}$ , PHASE OF  $g_A$  RELATIVE TO  $g_V$** 

Time reversal invariance requires this to be 0 or 180°. This is related to  $D$  given in the next data block and  $\lambda \equiv g_A/g_V$  by  $\sin(\phi_{AV}) \equiv D(1+3\lambda^2)/2|\lambda|$ ; this assumes that  $g_A$  and  $g_V$  are real.

-11 ± 17	STEINBERG 74	CNTR	Cold $n$ , polarized

<sup>1</sup>EROZOLIMSKII 78 says asymmetric proton losses and nonuniform beam polarization may give a systematic error up to  $30 \times 10^{-4}$ , thus increasing the EROZOLIMSKII 74 error to  $50 \times 10^{-4}$ . STEINBERG 74 and STEINBERG 76 estimate these systematic errors to be insignificant in their experiment.

### TRIPLE CORRELATION COEFFICIENT $R$

Another test of time-reversal invariance.  $R$  measures the polarization of the electron in the direction perpendicular to the plane defined by the neutron spin and the electron momentum.  $R = 0$  for T invariance.

<u>VALUE</u>	<u>DOCUMENT ID</u>	<u>TECN</u>	<u>COMMENT</u>
<b>+0.004±0.012±0.005</b>	<sup>1</sup> KOZELA	12	CNTR Mott polarimeter
• • • We do not use the following data for averages, fits, limits, etc. • • •			
+0.008±0.015±0.005	KOZELA	09	CNTR See KOZELA 12

<sup>1</sup>KOZELA 12 also measures the polarization of the electron along the direction of the neutron spin. This is nonzero in the Standard Model; the correlation coefficient is  $N = +0.067 \pm 0.011 \pm 0.004$ .

### FIERZ INTERFERENCE TERM $b$

The coefficient of the Fierz interference term,  $b$ , probes additional contributions to the differential decay rate of the neutron from scalar or tensor current interactions, beyond the Standard Model.

<u>VALUE</u>	<u>DOCUMENT ID</u>	<u>TECN</u>	<u>COMMENT</u>
<b>0.017±0.020±0.003</b>	<sup>1</sup> SAUL	20	SPEC Cold $n$ , polarized

<sup>1</sup>In a combined fit SAUL 20 extract this best fit value of the Fierz interference term  $b$  and the values  $A = -0.1209 \pm 0.0015$  and  $\lambda = -1.2792 \pm 0.0060$ . For  $b$  it translates into a 90% CL region of  $-0.018 \leq b \leq 0.052$  as a function of  $A$ .
